Final Project Proposal

My Final Project Proposal will be themed around Christmas.

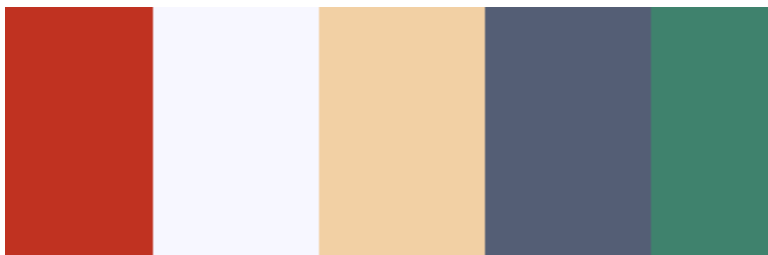

My inspirations are existing Christmas themed websites such as Santa Tracker by Google and North Pole.com which is a site that dates back to the 1990s and is primarily made up of Javascript, Webmail, and Adobe Flash. What I loved about these websites is the simplicity of Northpole.com, with its very visible grid layout and “raw” code that I could almost visualize. With Santatracker.google.com, I love the fluidity and cohesiveness of the website, mixed with the business and playful tone of images, animations, and reactive elements such as links and buttons.

Using a grid display structure for all three websites, I plan to make a fun holiday website that has one page for the home, one page for functional links to other websites or Christmas related things, and one page for some kind of unique christmas themed web experimental art. The color palette will follow typical Christmas color combos such as Red, Green, and White, with some hints of Gold, Silver, Bronze, and Orange. Some fonts that I might use will be Christmas themed. Mountains of Christmas and Berkshire Swash for the main typography, but Pinyon Script and Ballet for more formal use since they are sans script fonts.

This will be an inspiration from the Christmas websites northpole.com and santatracker.google.com. I love the multiple amounts of links and buttons that are usable and lead to other sites for more interaction. It gives a fun feeling of exploration because there are so

many things you can do on the site. I want the website to feel fun and playful, almost like it's geared for kids. Lots of reactive elements such as hover, animations, and perhaps some gifs for fun. I want animations to make the website feel more fluid and cohesive, therefore a loading animation could play in between each page transition or have a small loading animation play on each page. It would most likely be a simple rotating circle, or a holiday themed loading animation.

Color Palettes:
